

TASK-PROGESS REPORT

IMPLEMENTING WEB APPLICATION CREATE IBM DB2 AND CONNECT WITH PYTHON

Date	15 November 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

STEP 1: Import the ibm_db Python library:

```
!pip install --force-reinstall ibm_db==3.1.0
ibm_db_sa==0.3.7
import ibm_db
```

STEP 2: Identify the database connection credentials:

```
dsn_hostname = "2d46b6b4-cbf6-40eb-
bbce- 6251e6ba0300.bs2io90l08kqb1od8lcg.databases.appdomain.cloud"

dsn_uid = "vjd29721"
dsn_pwd = "6TTgx8MRBzT45o3q"
dsn_driver = "{IBM DB2 ODBC DRIVER}"
dsn_database = "BLUDB"# e.g. "BLUDB"
dsn_port = "32328"      # e.g. "32733"
dsn_protocol = "TCPIP"# i.e. "TCPIP"
dsn_security = "SSL" #i.e. "SSL"
```

STEP 3: Create the DB2 database connection:

```
dsn = (
    "DRIVER={0};"
```

```
"DATABASE={1};"
```

```
"HOSTNAME={2};"
```

```
"PORT={3};"
```

```
"PROTOCOL={4};"
```

```
"UID={5};"
```

```
"PWD={6};"
```

```
"SECURITY={7};").format(dsn_driver, dsn_database, dsn_hostname, dsn_port,  
dsn_protocol,dsn_uid, dsn_pwd,dsn_security) print(dsn)
```

Now establish the connection to the database:

```
conn = ibm_db.connect(dsn, "", "")  
print ("Connected to database: ", dsn_database, "as user:",dsn_uid,  
"on host: ",dsn_hostname)
```

except:

```
print ("Unable to connect:", ibm_db.conn_errormsg() )  
server = ibm_db.server_info(conn)  
  
print("DBMS_NAME:",server.DBMS_NAME)  
print ("DBMS_VER:", server.DBMS_VER)  
print ("DB_NAME:", server.DB_NAME)  
  
client = ibm_db.client_info(conn)  
print("DRIVER_NAME:",client.DRIVER_NAME)  
print("DRIVER_VER:",client.DRIVER_VER)  
print("DATA_SOURCE_NAME:",client.DATA_SOURCE_NAME)  
print("DRIVER_ODBC_VER:",client.DRIVER_ODBC_VER)  
print ("ODBC_VER:", client.ODBC_VER)  
print ("ODBC_SQL_CONFORMANCE: ", client.ODBC_SQL_CONFOR  
MANCE)  
  
print ("APPL_CODEPAGE: ", client.APPL_CODEPAGE)  
print("CONN_CODEPAGE:", client.CONN_CODEPAGE)
```

STEP 4: Close the Connection:

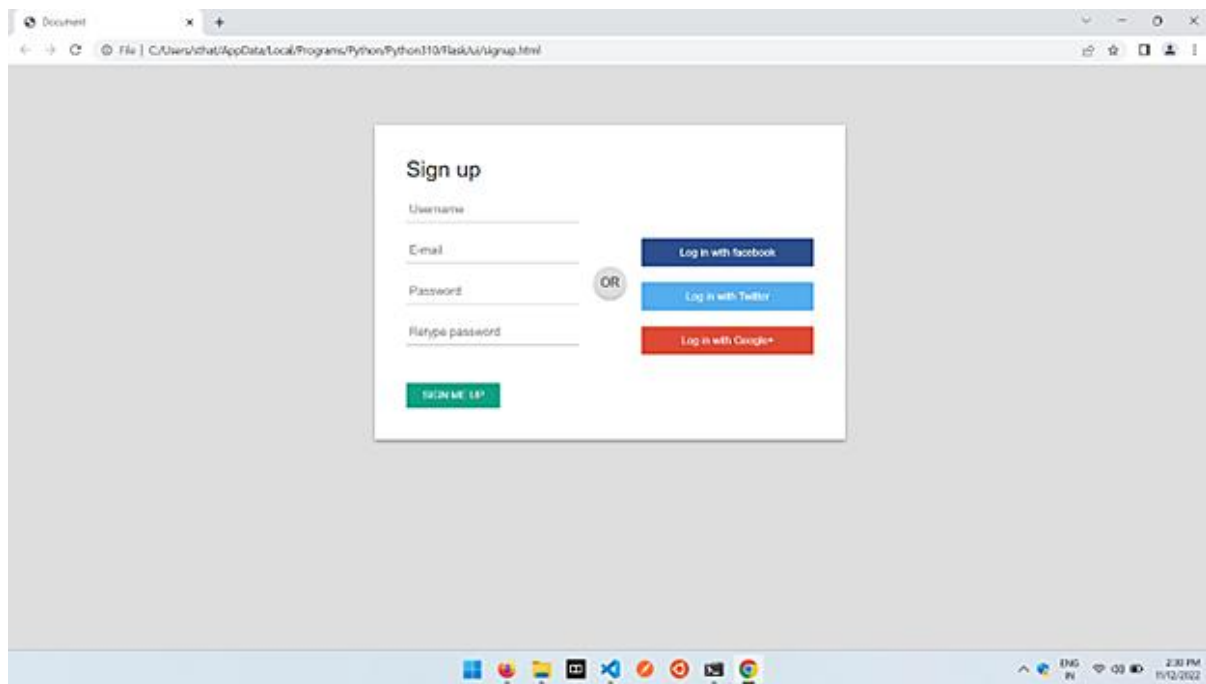

```
ibm_db.close(conn)
```

IMPLEMENTING WEB APPLICATION

Create UI to Interact with Application

Date	12 November 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Step 1: Sign up

The screenshot shows a web browser window with a single tab titled 'Document'. The address bar displays the file path: `C:\Users\chait\AppData\Local\Programs\Python\Python110\TaskAs\signup.html`. The main content area features a 'Sign up' form with the following elements:

- Sign up** (Section Header)
- Username** (Text input field)
- Email** (Text input field)
- Password** (Text input field)
- Retype password** (Text input field)
- Log in with facebook** (Blue button)
- Log in with Twitter** (Blue button)
- Log in with Google+** (Red button)
- OR** (Circular separator between social login buttons)
- SIGN ME UP** (Green button)

The Windows taskbar at the bottom shows the system clock as 2:30 PM on 11/12/2022, along with various system icons and application shortcuts.

Step 2: Login Page

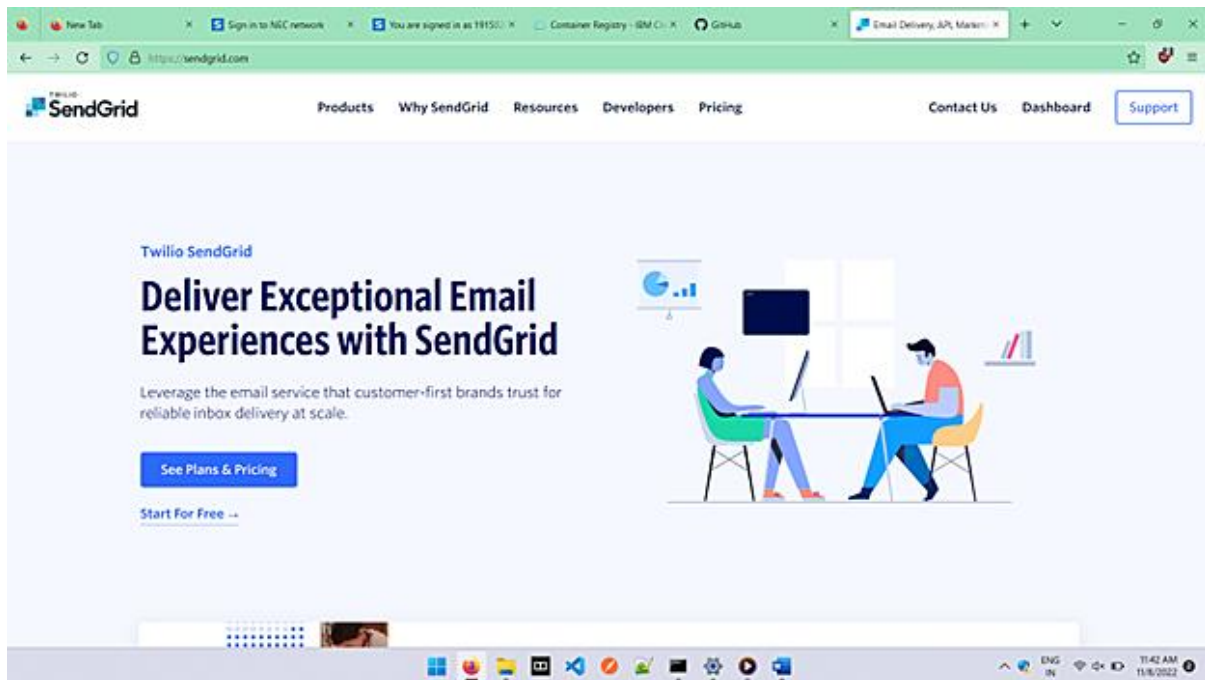

SETITNG UP APPLICATION ENVIRONMENT

Create an Account in Send Grid

Date	08 November 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Step 1: Navigate to <https://sendgrid.com>

Step 2: Click on start for free and register yourselves by entering required details and click on create account

The first screenshot shows the 'Let's Get Started' page on the SendGrid website. The page has a light blue background with a white form area. The form includes fields for 'Email Address' (49627955026@smartindia.com), 'Username' (ThatchamS), and 'Password' (a masked password). There is a checkbox for 'Use email address as username' and a 'Create Account' button. A 'Try it out!' section on the right lists benefits of SendGrid, such as 'Automated drip campaigns', 'Password resets', 'Newsletters', 'Receipts', 'Delivery notifications and updates', and 'Promoted emails'. A 'I'm not a robot' CAPTCHA and a checkbox for 'I accept the Terms of Service and have read the Privacy Notice' are also present.

The second screenshot shows the 'Tell Us About Yourself' page. This page has a white background with a light blue header. It includes fields for 'First Name' (ThatchamS), 'Last Name' (Sahasraset), 'Company Name' (National Engineering College), 'Company Website' (National Engineering College), 'Country Code' (India [+91]), and 'Phone Number' (8925199949). There is a section for 'What is your role?' with radio buttons for 'Developer' (selected), 'CEO', 'Marketer', and 'Other'. A section for 'How many emails do you send per month?' has radio buttons for various ranges, with '0 to 100,000' selected.

Output:

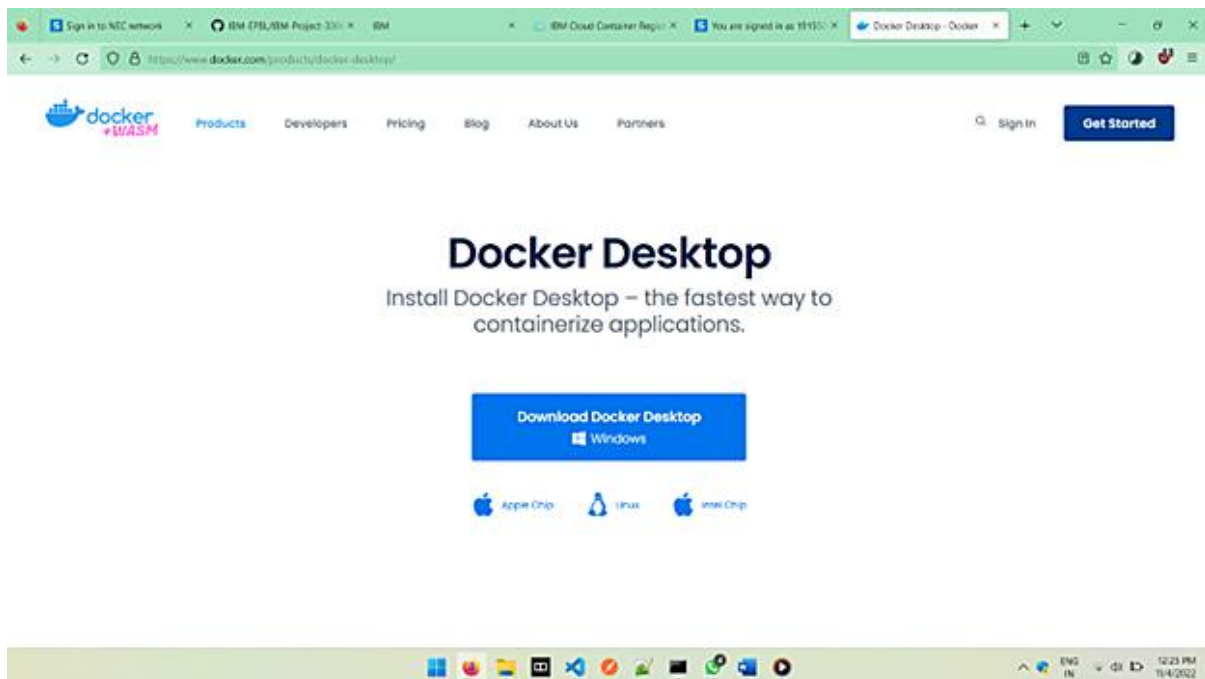

SendGrid account created successfully.

SETITNG UP APPLICATION ENVIRONMENT

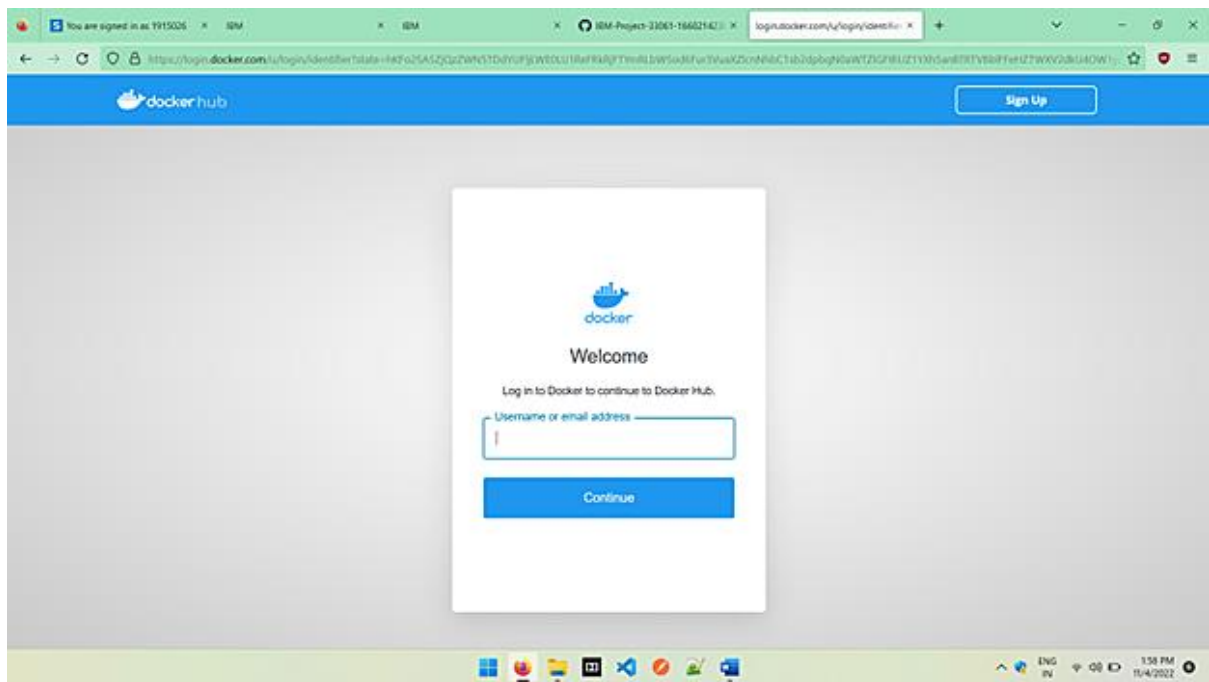

Docker CLI Installation

Date	07 November 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Step 1: Download Docker from docker.com and install it by running the docker Desktop installer.exe file

Step 2: Go to hub.docker.com register and create an account and login with the same.

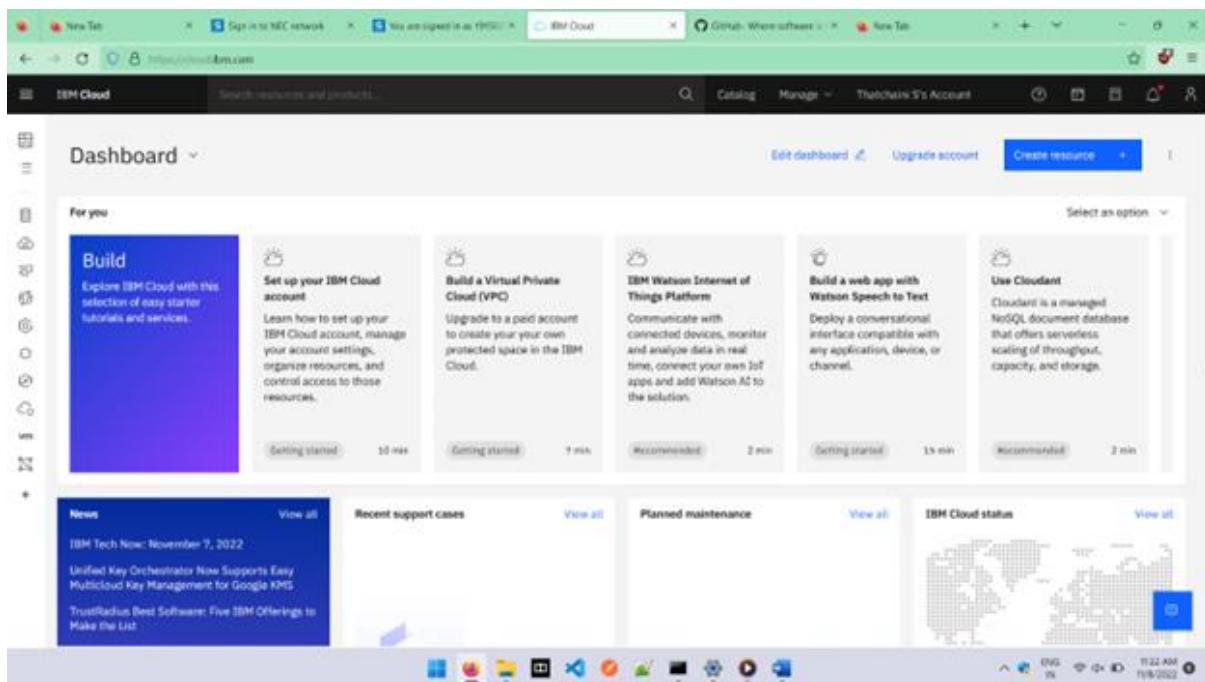

SETITNG UP APPLICATION ENVIRONMENT

Install IBM Cloud CLI

Date	04 November 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Step 1: Navigate to cloud.ibm.com

Step 2: Search on Container registry and give get started and follow the steps to install IBM Cloud CLI

The screenshot displays the IBM Cloud Container Registry page in a web browser. The page includes a navigation bar with the IBM Cloud logo, a search bar, and links to Catalog, Manage, and the user's account. The main content area features a 'Container Registry' header with a 'Get started' button. Below this, there is a 'Summary' section describing the service, followed by a 'Features' section highlighting 'Highly available and scalable private registry', 'Image security compliance with Vulnerability Advisor', and 'Quota limits for storage and pull traffic'. A 'Pricing plans' section is also visible.

Below the web page, a terminal window shows the command-line interface for installing IBM Cloud CLI. The user runs the command `ibmcloud login` and provides their API endpoint, email, and password. The terminal output shows the login process, including authentication and the selection of a region (jp-tok). The user then runs `ibmcloud target -g RESOURCE_GROUP`, which results in an error: 'Could not get resource group: the following error(s) occurred: failed to get a resource group.' The terminal also displays the targeted account and region.

```
Select C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.22021.678]

```

SETTING UP APPLICATION ENVIRONMENT

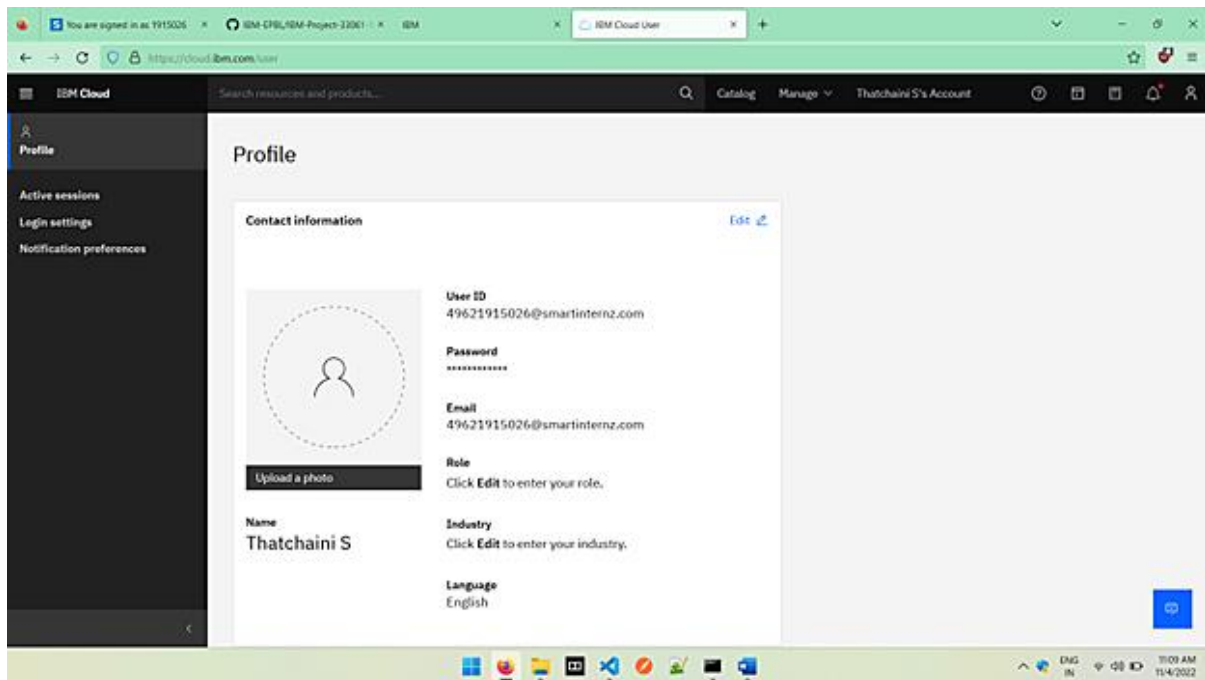

CREATE IBM Cloud Account

Date	04 November 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Step 1: Go to the official website <http://cloud.ibm.com/>

Step 2: Sign up using your credentials

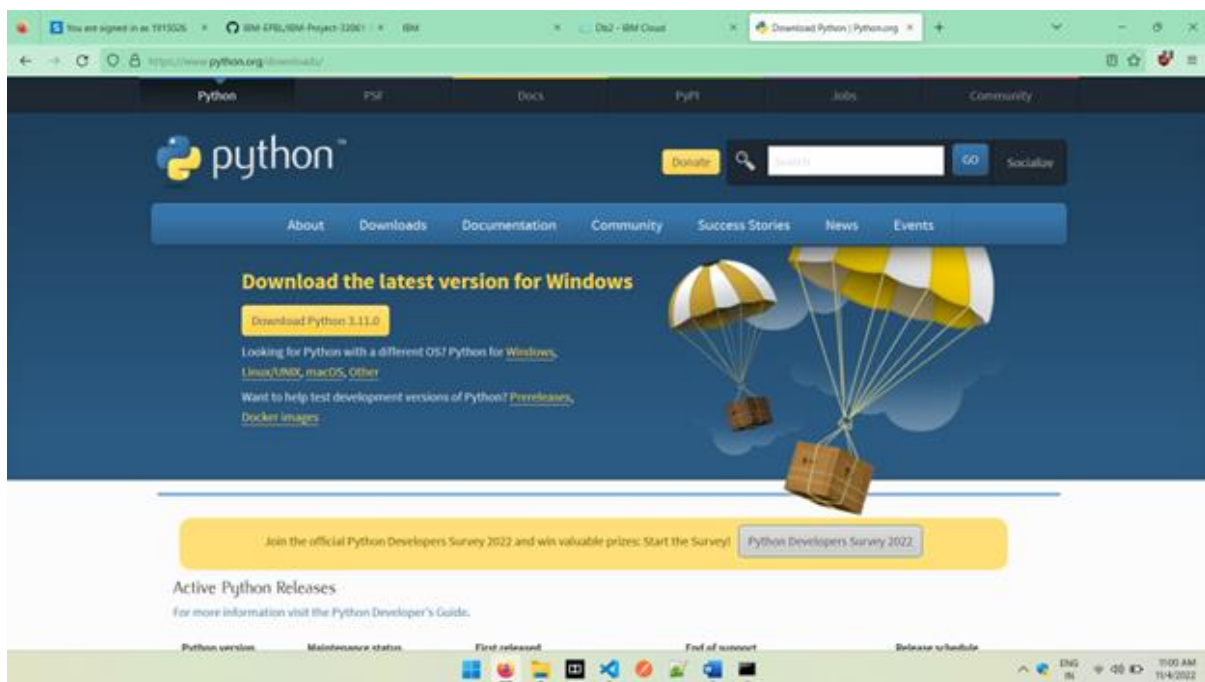

IBM Cloud Profile:

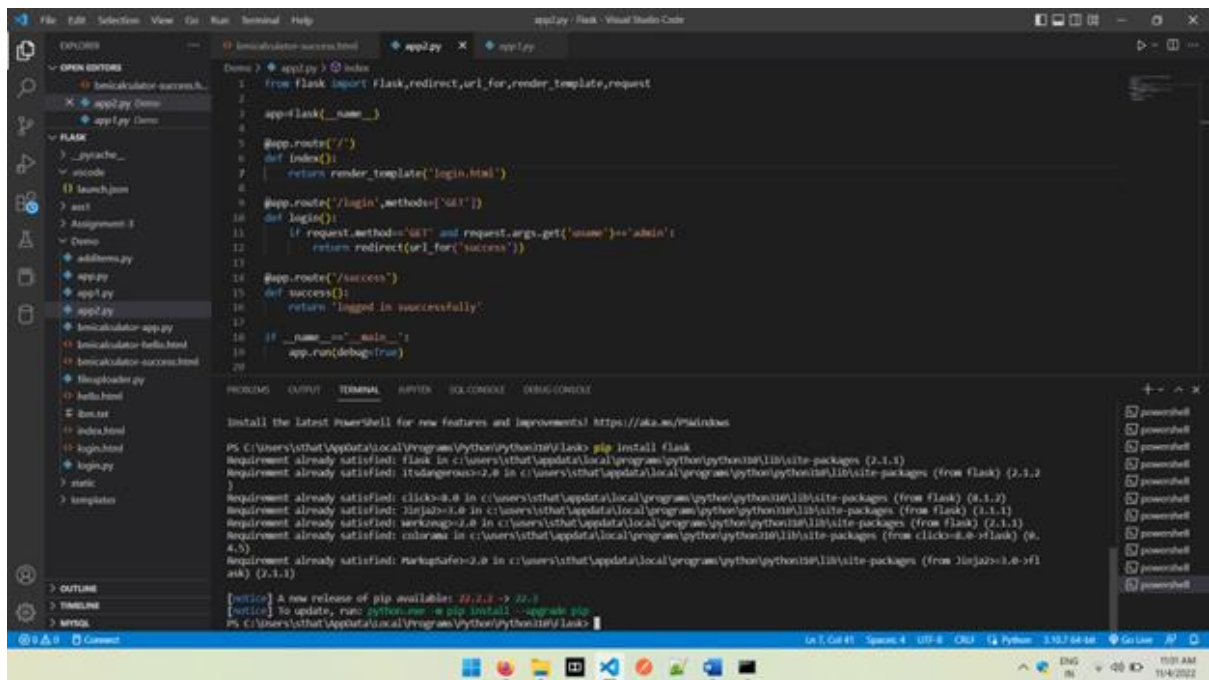

**SETITNG UP APPLICATION ENVIRONMENT
CREATE FLASK PROJECT**

Date	04 November 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Step 1: Install Python latest version from python.org

Step 2: Install flask using the command pip install flask

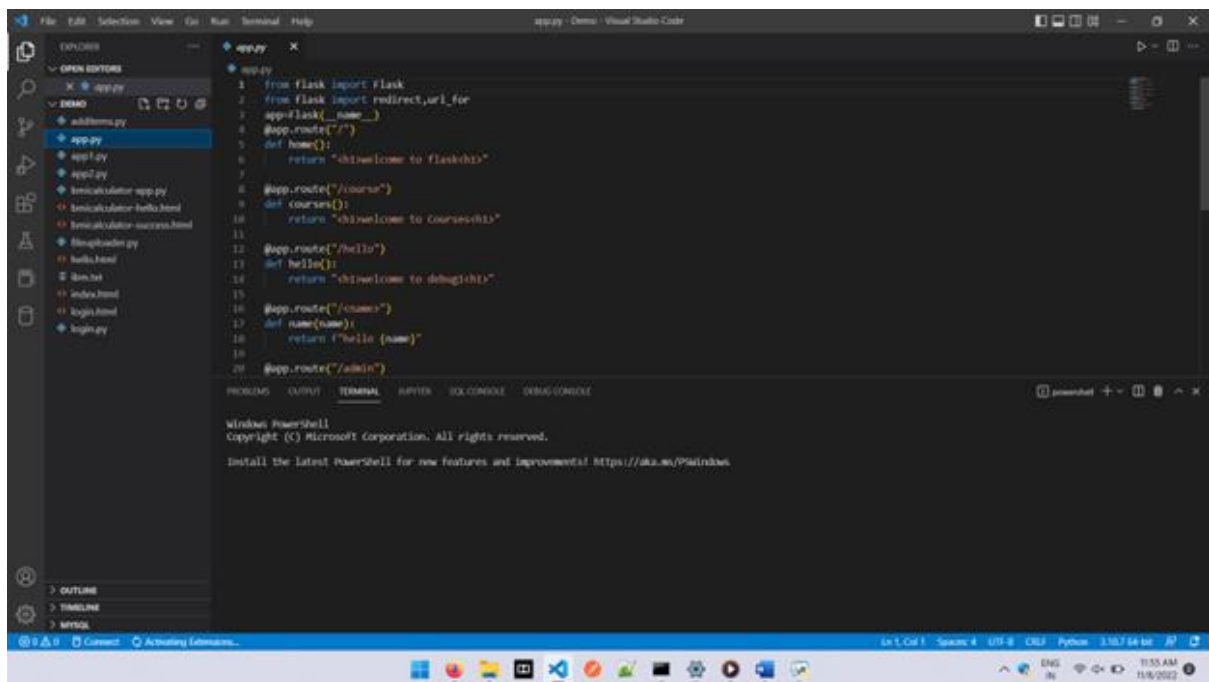

The screenshot shows the Visual Studio Code interface with a Python file named `app.py` open. The file contains the following code:

```
1 from flask import Flask, redirect, url_for, render_template, request
2
3 app = Flask(__name__)
4
5 @app.route("/")
6 def index():
7     return render_template("login.html")
8
9 @app.route("/login", methods=['GET'])
10 def login():
11     if request.method == 'GET' and request.args.get('name') == 'admin':
12         return redirect(url_for("success"))
13
14 @app.route("/success")
15 def success():
16     return "logged in successfully"
17
18 if __name__ == "__main__":
19     app.run(debug=True)
```

The terminal output shows the command `pip install flask` being executed. The output indicates that the requirements are already satisfied, and the installation is successful.

```
PS C:\Users\sthat\AppData\Local\Programs\Python\Python38\Flask> pip install flask
Requirement already satisfied: flask in c:\users\sthat\AppData\Local\Programs\Python\Python38\lib\site-packages (2.1.1)
Requirement already satisfied: itdangerous>2.0 in c:\users\sthat\AppData\Local\Programs\Python\Python38\lib\site-packages (from flask) (2.1.2)
Requirement already satisfied: click>8.0 in c:\users\sthat\AppData\Local\Programs\Python\Python38\lib\site-packages (from flask) (8.1.2)
Requirement already satisfied: Jinja2>3.0 in c:\users\sthat\AppData\Local\Programs\Python\Python38\lib\site-packages (from flask) (3.1.1)
Requirement already satisfied: Werkzeug>2.0 in c:\users\sthat\AppData\Local\Programs\Python\Python38\lib\site-packages (from flask) (2.1.1)
Requirement already satisfied: MarkupSafe>2.0 in c:\users\sthat\AppData\Local\Programs\Python\Python38\lib\site-packages (from Jinja2>3.0->flask) (2.1.1)
[notice] A new release of pip available: 22.0.2 -> 22.1
[notice] To update, run: python.exe -m pip install --upgrade pip
PS C:\Users\sthat\AppData\Local\Programs\Python\Python38\Flask>
```

The screenshot shows the Visual Studio Code interface with a Python file named `app.py` open. The file contains the following code:

```
1 from flask import Flask
2 from flask import redirect, url_for
3 app = Flask(__name__)
4
5 @app.route("/")
6 def home():
7     return "this welcome to flask this"
8
9 @app.route("/courses")
10 def courses():
11     return "this welcome to courses this"
12
13 @app.route("/hello")
14 def hello():
15     return "this welcome to debug this"
16
17 @app.route("/names")
18 def name(name):
19     return "hello {name}"
20
21 @app.route("/admin")
```

The terminal output shows the command `python.exe -m pip install --upgrade pip` being executed. The output indicates that the requirements are already satisfied, and the installation is successful.

Product Backlog,Sprint Schedule, and Estimation (4 Marks)

Use the below template to createproduct backlog and sprint schedule.

Sprint	Functional Requirements (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
S-1	User Panel	US N-1	The user will access the website and view the products it provides after registering in.	20	High	Thatchai ni S Muthula kshmi A Venkatraman S Pradeep Rajadurai W
S-2	Admin panel	US N-2	The administrator's task is to look over the stock database and monitor on everything that people are buying.	20	High	Thatchai ni S Muthula kshmi A Venkatraman S

						Pradeep Rajadura i W
S-3	Chat Bot	USN-3	The user can directly talk to Chatbot regarding the products. Get the recommendations based on information provided by the user.	20	High	Thatchai ni S Muthula kshmi A Venkatra man S Pradeep Rajadura i W
S-4	final delivery	USN-4	Container of applications using docker kubernetes and deployment the application. Create the documentation and final submit the application	20	High	Thatchai ni S Muthula kshmi A Venkatra man S Pradeep Rajadura i W

Project Tracker, Velocity& Burndown Chart:(4 Marks)

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End-Date(Planned)	Story Points Completed (as on planned date)	Sprint Release Date(actual)
S-1	20	6 Days	24 Oct2022	29 Oct 2022		29 Oct2022
S-2	20	6 Days	31 Oct2022	05 Nov 2022		05 Nov 2022
S-3	20	6 Days	07 Nov 2022	12 Nov 2022		12 Nov 2022
S-4	20	6 Days	14 Nov 2022	19 Nov 2022		19 Nov 2022

Velocity:

Imagine we have a 10-daysprint duration, and the velocityof the team is 20 (Points per sprint). Let's calculate the team's average velocity (AV) per iterationunit (story points per day)

PROJECT PLANNING PHASE
PREPARE MILESTONE AND ACTIVITY LIST

Date	30 October 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Remaining Task:

MILESTONES	ACTIVITY	DESCRIPTION
Project development phase	Delivery of Sprint-1,2, 3,4	To develop the code and submit the developed code after completion of testing
Implementing web application	Create UI to interact with the application	Create UI <ul style="list-style-type: none"> • registration page • login page • view products page • add products page

	Create IBM DB2 and connect with the Python	Create an IBM DB2 in the IBM cloud and connect it to Python.
Integrating send grid service	SendGrid integration with the Python	The SendGrid services must be integrated in order for the application to send emails.
Developing a chat bot	Building a chat bot and integrate with The application	Build the chat bot and integrate it to the flask application
Deployment of app in IBM cloud	Containerize the app	Create a docker image of the application in addition to push it to the IBM container registry
	Upload image to IBM container registry	Upload the image to IBM container registry
	Deploy in Kubernetes cluster	Once the image is uploaded to IBM container registry deploy the image toward IBM Kubernetes cluster

Completed Tasks:

MILESTONES	ACTIVITY	DESCRIPTION
Ideation phase	Literature survey	Literature survey on the selected project and information gathering

	Empathy map	Prepare empathy map to capture the user pain and gains, prepare a list of problem statement
	Ideation	Organizing the brainstorming session and prioritize the top three ideas based on feasibility
Project design phase 1	Proposed solution	Prepare proposed solution document which includes novelty, feasibility of ideas, business model, social impact, scalability of solution
	Problem solution fit	Prepare problem solution fit documents
	Solution architecture	Prepare solution architecture document
Project design phase 2	Customer journey map	Prepare customer journey map to understand the user interactions and experience with the application
	Functional requirements	Prepare functional and non-functional necessity document
	Data flow diagram	Prepare data flow diagram and user stories
	Technology architecture	Draw technology architecture diagram

	Sprint delivery plan	Prepare sprint delivery plan
--	----------------------	------------------------------

Setting-up appenvironme nt	Create IBM cloud account	Sign up IBM cloudaccou nt
	Create flask project	Getting started with theflask to create project
	Install IBM cloud cli	Install IBMcommandline interface (CLI)
	Docker CLI installatio n	Installing dockerCLI

Project Design Phase-II
Customer Journey Map

Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Project Design Phase-II

Technology Stack (Architecture & Stack)

Date	20 October 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Technology Architecture:

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table2

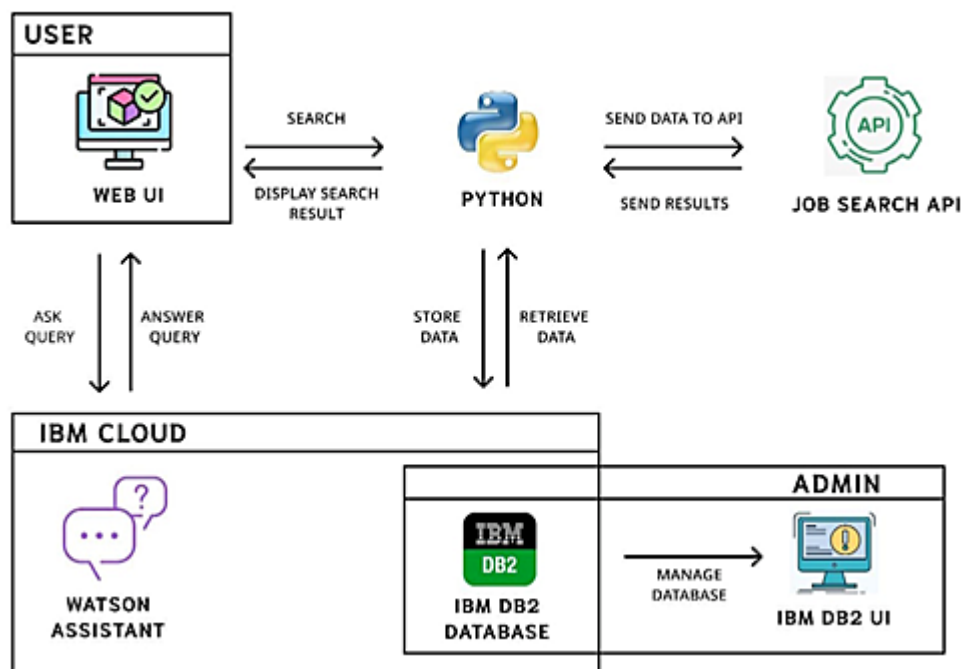

Table-1: Components & Technologies:

S	Component	Description	Technology
1	User Interface	How user interacts with application e.g., Web UI, Mobile App, Chat bot etc.	HTML, CSS, JavaScript, Bootstrap
2	Application Logic-1	Logic for a process in the application	Python
3	Application Logic-2	Logic for a process in the application	IBM Watson STT service

4	Application Logic-3	Logic for a process in the application	IBM WatsonAssistant
5	Database	Data Type,Configurations etc.	MySQL
6	Cloud Database	Database Serviceon Cloud	IBM DB2, IBM Cloudant etc.
7	File Storage	File storage requirements	IBM Block Storage or Other StorageService or Local Filesystem
8	Infrastructure (Server / Cloud)	Application Deployment on Local System/ Cloud LocalServer Configuration: Cloud ServerConfiguration:	Local, CloudFoundry, Kubernetes, etc.

Table-2: Application Characteristics:

S . N o	Characteristi cs	Description	Technology
1 . .	Open- Source Frame works	List the open-source frameworks used	IBM cloud Kubernetes service
2 . .	Security Imple mentations	List allthe security / access controls implemented, use of firewalls etc.	e.g., SHA- 256, Encryptions , IAMContro ls, OWASP etc.
3 . .	Scalable Archi tecture	Justify the scalability of architecture (3 – tier, Micro-services)	Technology used
4 . .	Availability	Justify the availability of application (e.g.,use ofloadbalancers, distributed servers etc.)	Technology used

5	Performance	Design consideration for the performance of the application (number of requests per sec, use of Cache, use of CDN's) etc.	Technology used
---	-------------	---	-----------------

Project Design Phase-II
Data Flow Diagram & User Stories

Date	12 October 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

Example:

User Stories

User Type	Functional Requirement	User Story Number	User Story/ Task	Acceptance criteria	Priority	Release
-----------	------------------------	-------------------	------------------	---------------------	----------	---------

	(Epic)					
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	I can access my account /dashboard	High	Sprint-1
		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	Sprint-1
		USN-3	As a user, I can register for the application through LinkedIn	I can register & access the dashboard with LinkedIn Login	Low	Sprint-2
		USN-4	As a user, I can register for the application through Gmail	I can register and access the dashboard through Gmail also	Medium	Sprint-1
	Login	USN-5	As a user, I can log into the application by entering email & password	I can log on to the application through email and	High	Sprint-1

				d password		
	Dashboard	USN-6	As a user, I can login and chat with thechatbot	Once I logge d on the application I can chat withthecha tbot	Hi gh	Sp rin t-3
Customer (Webuser)	Registration	USN-7	As a user, I can log on and register the application for the ser vices being provided	I can access my account /dashboard	Hi gh	Sp rin t-1
		USN-8	As a user, I will receive confirmation emailonceI have registere d for the application	I can receive confirmati onemail& click confirm	Hi gh	Sp rin t-1
	Login	USN-9	As a user, I can log into the application byentering email& passw ord	I can log on to the applicatio n through emailidan d password	Hi gh	Sp rin t-1

Customer care executive	Should Regularize the Send grid service	USN-10	As a executive and service operator of the service they should make sure that service provided are properly send and received by the user.		High	Sprint-2
	Should monitor the chatbot regularly whether working or not	USN-11	As a executive to provide a quality based service chatbot is important for assisting if any assistance is needed for the user		High	Sprint-2

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	13 October 2022
Team ID	PNT2022TMID20598
Project Name	Skill / Job Recommender-Cloud Application Development
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	<ol style="list-style-type: none"> 1. Registration through Form 2. Registration through Gmail 3. Registration through LinkedIn
FR-2	User Confirmation	<ol style="list-style-type: none"> 1. Confirmation via Email 2. Confirmation via OTP
FR-3	Job profile display	Display job profiles based on availability, location, skills
FR-4	Chatbot	A chat on the webpage to solve user queries and issue
FR-5	Job registration	Copy of the company the user applied for with its registration/description details will be sent to the registered email id.
FR-6	Logout	

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	<ol style="list-style-type: none">1. The webpage will be designed in such a way that any non-technical user can easily navigate through it and complete the job registration work. (Easy and Simple design.)2. Reduce information overload by generating personalized job suggestions.
NFR-2	Security	<ol style="list-style-type: none">1. Using of SSL certificate (Python Flask to Cloud connect) will provide security to the project.2. Database will be safely stored in DB2.
NFR-3	Reliability	To make sure the webpage doesn't go down due to network traffic.
NFR-4	Performance	<ol style="list-style-type: none">1. Focus on loading the webpage as quickly as possible irrespective of the number of user/integrator traffic.2. Carry out an evaluation to quantify empirically the recommendation abilities of two state-of-the-art methods, considering different configurations, within the proposed framework

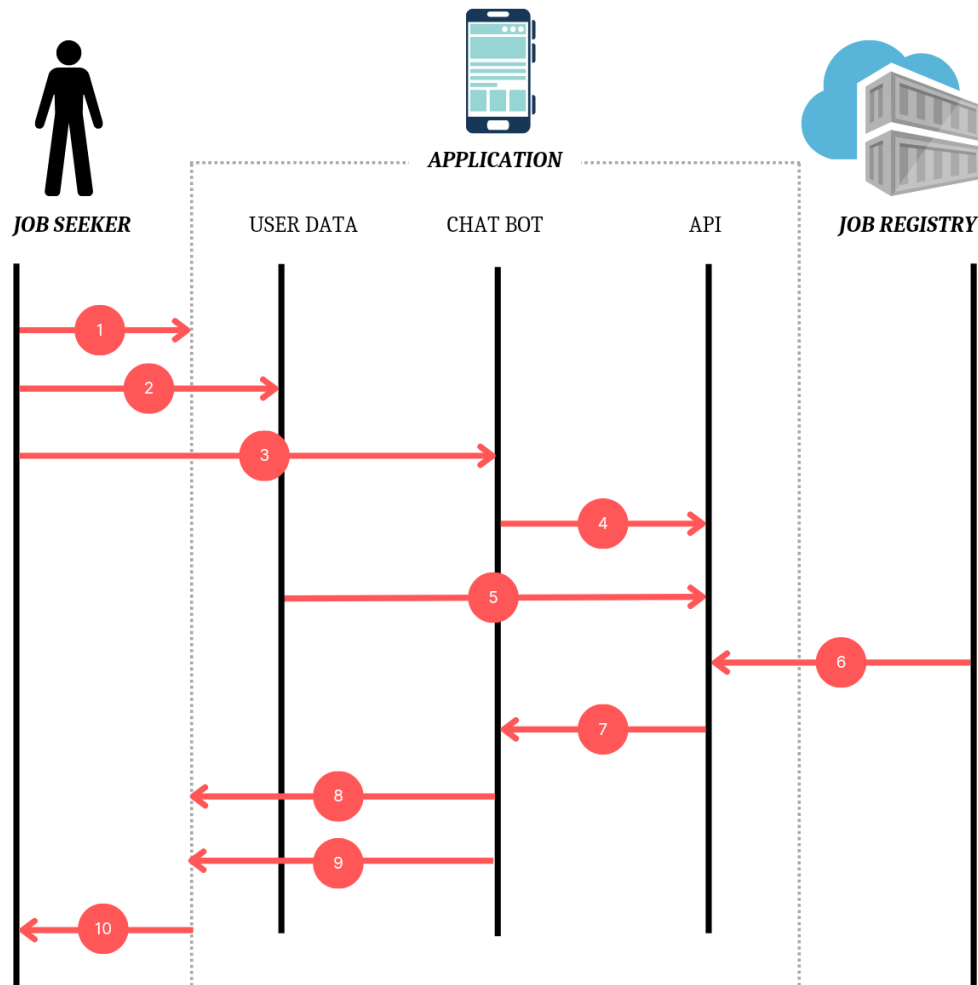

NFR-5	Availability	<ol style="list-style-type: none"> 1. The scraper is set up to avoid duplicate job offers, thus all the job offers are unique. 2. To making the user reliable. This webpage will be available to all users (network connectivity is necessary) at any given point of time. 3. Made publicly available a new dataset formed by a set of job seekers profiles and a set of job vacancies collected from different job search engine sites.
NFR-6	Scalability	<ol style="list-style-type: none"> 1. Increasing the storage space of database can increase the number of users. 2. Add some features in future to make the webpage unique and attractive

Solution Architecture

Title: Skill/Job Recommender

Technology: Cloud Application Development

Team ID: PNT2022TMID20598

1.Create user profile

2.Stores user data

3.Make chat request using assistant

4.Search jobs based on user details

5.Fetch jobs based on user skills

6.Search job openings

7.Post job openings

8.Display job openings

9.Filter appropriate Job profile

10.Notify results

1.	<p>Problem Statement</p> <p>(Problems to be solve)</p>	<ol style="list-style-type: none"> 1. Having better skills but wondering which job will best suits you? 2. We are giving opportunity to job Seekers. 3. User can access large no of data. 4. Having lots of skills but wondering which job will best suit you? Don't need to worry! We have come up with a skill recommender solution through which the fresher or the skilled person can log in and find the jobs by using the search option or they can directly interact with the chatbot and get their dream. 5. To develop an end-to-end web application capable of displaying the current job openings based on the user skillset. The user and their information are stored in the Database. An alert is sent when there is an opening based on the user skillset. Users will interact with the chatbot and can get the recommendations based on their skills. We can use a job search API to get the current job openings in the market which will fetch the data directly from the webpage.
----	--	---

2.	Idea/ Solution description	<ol style="list-style-type: none"> 1. To focuses on fit for feature. 2. To provide user what company expect. 3. Made publicly available a new dataset formed by a set of job seekers profiles and a set of job vacancies collected from different job search engine sites. 4. Put forward the proposal of a framework for job recommendation based on professional skills of job seekers. 5. Carried out an evaluation to quantify empirically the recommendation abilities of two state of the art methods, considering different configurations, within the proposed framework. 6. We thus present a general panorama of job recommendation task aiming to facilitate research and real-world application design regarding this important issue.
----	----------------------------	--

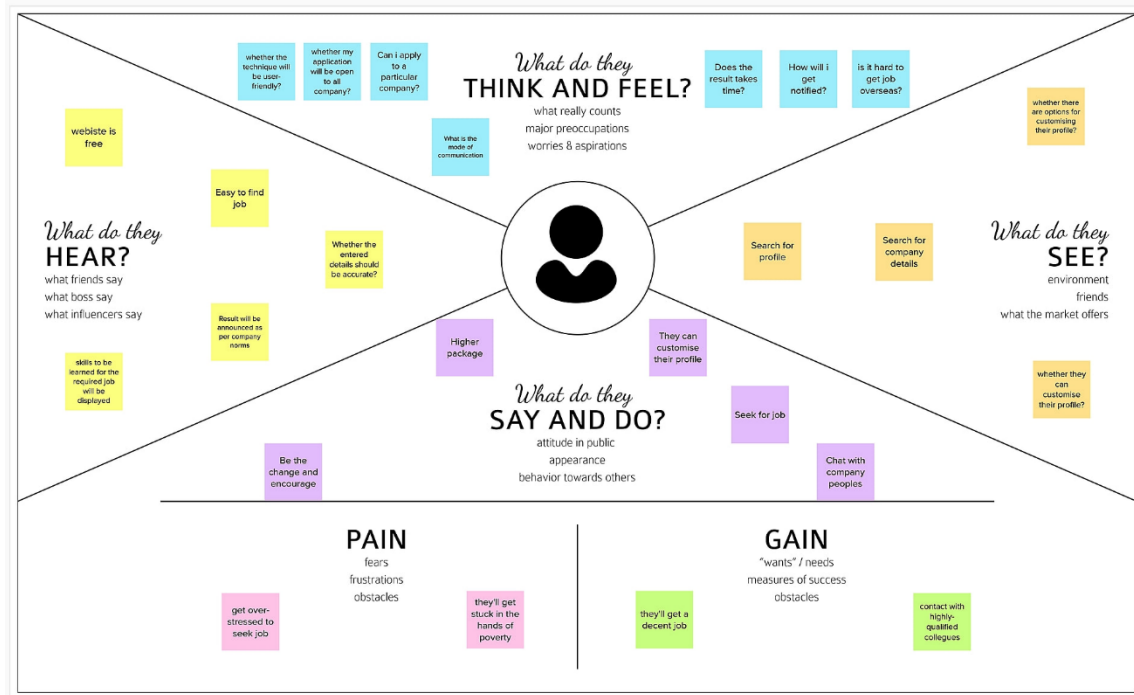

3.	Novelty / Uniqueness	<ol style="list-style-type: none"> 1. We provide high Data Security. 2. We provide Mobile and computer both platforms. 3. The best position is suggested to any person according to her skills. While the position of known profiles is assumed to be correct, it should be noted that there are usually multiple advisable positions corresponding to a set of skills. A recommendation system should return a set of most likely positions and all of them can be equally valid. 4. The recommendation method we use is simply based on representing both positions and profiles as comparable vectors and seeking for each profile the positions with the most similar vectors.
4.	Social Impact / Customer Satisfaction	<ol style="list-style-type: none"> 1. At last, we believe that two people with equal talent should have equal access to opportunity and we're committed to making this vision reality through our project. 2. We are providing Friendly approach and employability. 3. Students will be benefited as they will get to know which job suits them based on their skills.

5.	Business Model (Revenue Model)	<ol style="list-style-type: none"> 1. We are connecting you with other professionals also with companies and recruiters. Along with professionals, it also serves companies and even charges for providing certain premium services. 2. We can provide the application for job seekers in a subscription based and we can share the profiles with companies and generate the revenue by providing them best profiles
6.	Scalability of the Solution	<ol style="list-style-type: none"> 1. Scalability is a custom training and organizational development firm dedicated to helping businesses scale. 2. Data can be scaled up and scaled down according to number of current job openings.

Empathy Map Canvas

Skill Job Recommender

Literature Survey

a. Introduction

The recommender system is becoming part of every business. The business tries to increase its revenue by raising the user's interaction by recommending new items based on user preferences. We have witnessed the rise of Netflix in the entertainment domain, using their strategies to implement a recommender system into their existing ecosystem. But there has been a minimal study in the hiring field from the perspective of a job seeker. To start any research, it is quintessential to review relevant work in the domain and technology.

1.2 Recommender Systems

As discussed previously, RecSys are the system that analyses user preference history and cater them with different options of services related to the requirement. Recommender systems emerged as an independent research area in the mid-1990s (Ricci *et al.*, 2011). In recent years, the interest in recommender systems has dramatically increased. In the Recommendation algorithm, it classifies into four types: Content-based filtering, Collaborative filtering, Rule-based, and Hybrid approaches (Mobasher, 2007; Al-Otaibi and Ykhlef, 2012).

Collaborative Filtering (CF): Collaborative Filtering is a technique is based on the human ratings that are given to an item by a user and find similarity between different users who have given similar ratings to an item (Hu and Pu, 2011). The essential operation used here is the memory-based nearest neighbor approach to group users who have a similar interest. As the volume of data grows gradually, there will be high latency in generating recommendations (Mobasher (2007); Herlocker *et al.* (1999)). Collaborative filtering has an advantage over content-based filtering techniques, but due to the nature of the hiring process, a job cannot be rated by the user and will not be possible to create a similarity matrix.

Content-based filtering (CBF): These are the most subjective and descriptive based filtering. Content-based filtering can also be called as attribute-based recommender as it uses the explicitly defined property of an item. It is an approach to an information

retrieval or machine learning problem. The assumption made in content-based filtering is that user prefers item with similar properties. Content-based filtering recommends items to the user whose properties are similar to the item which the user has previously shown interest. Mobasher (2007) express that drawback of this filtering technique is their tendency to over-specialize in suggesting the item to a user profile as user profiles are relayed on an attribute of the previous item opted by the user. Nevertheless, in the job domain, the job listed in the job board be available only for few days; due to the nature of the domain, the tendency to over-specialize in recommending the same item would not be any problem in the job domain recommender system. In domains like entertainment, user preference tends to change depending on various factors, but In Job domain, the user tends to look for the job where he can use his previous skills. New recommendation of jobs can be made when there is a change in user preference, i.e. if a user thinks to change his/her job domain by updating his new skills and the job domain if he/she wishes. Another scenario of new recommendation is when new jobs are listed in the database; system would identify the properties of the job listed, such as

job domain and skills required for the job and matches with the users with a high similarity score.

Rule-

based Filtering (RBF): These filtering techniques depend upon decision rules such as an automatic or manual decision rule that are manipulated to obtain a recommendation for the user profile. Currently, the E-commerce industry uses a rule-based filtering technique to recommend an item based on the demographic region of a user, purchase history, and other attributes that can be used to profile an user. A drawback in rule-based filtering is user feeds the information to the system. These inputs are utilized as a

description of a user profile or can be considered as a preference of a user, defined by the user. Thus the data acquired is prone to bias. With the age of the user's profile, recommendation tends to hit the saturation and become static Mobasher_(2007).

Hybrid filtering (HF): As the title describes, its incorporation of multiple techniques to improve the performance of recommendation. The previously discussed recommendation technique has its weakness and strengths. In order to get a better recommendation and overcome the challenges posed by earlier techniques, this technique is sought after. All of the learning/model-based techniques suffer from cold-start in one or other form. It is a problem related to handling a new user or new item. These and other shortcomings of the CF, CBF, and RBF could be resolved by using hybrid filtering techniques Burke (2007); Jain and Kakkar(2019); Dhameliya_and_Desai_(2019).

The surveys conducted by Burke (2002) and Dhameliya and Desai (2019) have identified different types of hybrid filtering techniques that could be used by integrating CF, CBF, and RBF.

- i. Weighted: The similarity score obtained from different recommendations on components are coupled numerically to get one better recommendation.
- ii. Mixed: Recommendations obtained from different recommending techniques are put together and presented as one recommendation.
- iii. Switching: choosing one among the recommendation components based on the scenarios where it suits best.
- iv. Feature Combination: Attributes derived from diverse knowledge origins are fused and supplied to a recommendation algorithm.
- v. Feature Augmentation: One recommendation technique is used to compute a set of attributes of user or item, which is then part of the input to the next recommendation technique. Two or more recommendation techniques are serialised to get one recommendation.

- vi. Cascade: Recommending systems are given strict priority, with the lower priority ones breaking ties in the scoring of the higher ones. Here one Recsys technique refines recommendation of another.

There had been attempts to develop a recommendation system by several researchers. One such implementation was done by Rafter *et al.* (2000). They had devised a hybrid Recsys CASPER for Job finding search engine. They had implemented an automated collaborative filtering module and personalized case retrieval module in their job recommendation system. ACF module utilized user behavior information such as read time and activity on the page during his time on the system to profile the user. Similarity measure such as the Jaccard index and other clustering algorithms was used for similar grouping user against target user. Their other module PCR finds the similarity between the user's query and jobs in the system. The module computes similarity with a target user's query and jobs from the job case base using different similarity measures. This system has faced sparsity and scalability problems.

a. Natural language processing

These are the times that can be considered as an era of data. Every keystroke hit on twitter, online news, or in a research paper is recorded somewhere on the internet. All the generated data are available for the analysis through many means. In this abundance of data, Text data holds the majority of the share. Most of these text data are in an unstructured form. To put the abundance of text data into a perspective, a trillion-plus query per year is being handled by Google, and Whatsapp handles 30+ billion messages per day. That being said, how do we extract information from the unstructured text data or how can we make machine understand what the text is about? To answer all the questions, Text analysis is a most sought after technique to extract useful information from the text data. Text analysis can be performed by utilizing techniques such as Natural language processing. Natural language processing is a process of information retrieval from unstructured data. It refers to the utilization of computers to process natural language (Brants, 2003). The advancement in the personal assistant, text summarizing, and methods to caption a subject is due to the successful research in the field of NLP. Search engines like

google and other industry leaders utilize NLP to its full extent. The gap between industry and academia in the field of NLP is very minimal as there is an advancement in the NLP; the business has tried implementing and has brought closer to everyone's life.

In Recsys for the hiring domain, the data we handle here is nothing other than text data. A user profile describes the details about user experience and skills he/she is familiar with. On the other hand, the job listed has information as job title, skills required to fulfill the role. All this information is filled with text data. In this scenario, we utilize the Natural Language Processing to measure the similarity between Jobs by checking the similarity between the job title and job description of the listed job. Determining the text-similarity is an essential task in several industrial applications such as query search, text summarizing and video tagging (Kenter and De Rijke, 2015). In earlier studies, researchers have used

different approaches to identify similarity between the text by using edit distance algorithm which is discussed by Mihalcea *et al.* (2006), lexical overlapping technique (Jijkoun *et al.*, 2005) as this might work in most cases but can't rely on these techniques because of its frail nature (Kenter and De Rijke, 2015). In such cases, we rely on a technique called word embedding. This is a huge development in the field of distributional semantics. As this requires only a large amount of unlabelled word data. These words are represented in semantic space as a vector. That is, words that are semantically similar will stay close in the semantic space. In order to retrieve terms that are based on the similarity between two terms, we can utilize the most well known method called word2vec a vector space model then we can use cosine similarity to measure the similarity between them (Shrestha, 2011; Barrón-Cedeno *et al.*, 2009).

This model can also be used to determine similarity between the sentences (Barzilay and Elhadad, 2003). It's a group related model which is used to produce word embedding and these are a set of language modelling and feature learning techniques of NLP where words are mapped to real values in the vector. Typically word2vec takes a large set of words which is called corpus as an input and produces a vector space with dimensions being in hundreds (Mikolov *et al.*, 2013). Once a vector space model is generated we can use similarity measuring methods to determine the distance or how similar is the word with which we are comparing. To

find similarity in vector space we can use similarity measures like Cosine similarity and Jaccard similarity.

- i. **Jaccard Coefficient:** Jaccard Coefficient is a method to compare elements of two sets to identify which elements are shared between two sets and which are distinct. It's similarity measure for two sets of data with result ranging from 0% to 100%. Two sets can be said similar, when result is close to 100%. Formula for Jaccard Index is as shown below (Sternitzke and Bergmann, 2009),
- i. **Cosine similarity:** Cosine similarity is also a measure to find similarity between two sets of non zero vector. It is a weighted vector space model utilized in the process of information retrieval. The similarity is measured by using euclidean cosine rule, i.e., by taking inner product space of two non zero vector that measures the cosine of the angle between the two vectors. If the angle between two vectors is 0 deg, then the cosine of 0 is 1; Meaning that the two non zero vectors are similar to each other. In order to weight the words we have used the well-known word2vec vector space model (Rong, 2014; Herremans and Chuan, 2017).

2.2 Inferences

Based on all the research methodologies and techniques reviewed in this chapter, the CF technique cannot be considered as it does not satisfy the aims of the research. As the dataset of the user does not hold the information of rating against a particular job, we will not be able to create a rating matrix that requires for CF technique. Instead, I have chosen to implement content-

based filtering. I used multiple attributes in the user data to create a user profile and recommend the job to those profiles which have a high similarity score received from cosine similarity. Also, I have given higher weights to job skills when compared to the job domain of the user while computing similarity scores between user profile and job.
